

Python Data Types – Beginner Notes

1. Integer (int)

Stores whole numbers without decimals.

Example: `age = 20`

2. Float (float)

Stores numbers with decimal points.

Example: `price = 99.5`

3. Complex (complex)

Stores real and imaginary numbers.

Example: `num = 3 + 2j`

4. String (str)

Stores text or characters.

Example: `name = "Python"`

5. Boolean (bool)

Stores True or False values.

Example: `is_active = True`

6. List (list)

Stores multiple items, ordered and changeable.

Example: `marks = [80, 85, 90]`

7. Tuple (tuple)

Stores multiple items, ordered and unchangeable.

Example: `days = ("Mon", "Tue")`

8. Set (set)

Stores unique items only.

Example: `vowels = {'a', 'e', 'i'}`

9. Dictionary (dict)

Stores data in key-value pairs.

Example: `student = {"name": "Ali", "age": 18}`

10. Range (range)

Represents a sequence of numbers.

Example: `numbers = range(1, 5)`

11. None (NoneType)

Represents absence of a value.

Example: `result = None`

12. Bytes (bytes)

Stores immutable binary data.

Example: `data = b"ABC"`

13. Bytearray (bytearray)

Stores mutable binary data.

Example: `data = bytearray(4)`

14. Frozen Set (frozenset)

Immutable version of a set.

Example: `nums = frozenset([1, 2, 3])`
